

11. From a point P which is at a distance of 13 cm from centre O of a circle of radius 5 cm, in the same plane, a pair of tangents PQ and PR are drawn to the circle. Area of quadrilateral PQOR is

65 sq cm

60 sq cm

30 sq cm

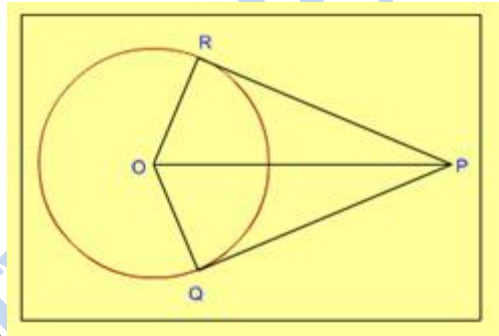

90 sq cm

Answer (b). $OP = 13$ cm and $OR = OQ = 5$ cmgiven

Angle ORP and $OQP = 90^\circ$...radius is perpendicular to a tangent at the point of incidence.

Applying Pythagoras PR and $PQ = 12$ cm.

Area of each triangle = $(5 \times 12)/2 = 30$ sq cm.

Thus area of quadrilateral = 60 sq cm.

12. The diameters of two circles are the side of a square and the diagonal of the square. The ratio of the areas of the smaller circle and the larger circle is

$\sqrt{2} : \sqrt{3}$

$1 : \sqrt{2}$

$1 : 2$

$1 : 4$

Answer (c). Let the side of the square be 1 unit. The diagonal of the square would be $\sqrt{2}$ units. (since area of a square is given by side^2 or $\text{diagonal}^2/2$.)

Radius of smaller circle = $1/2$ unit and its area = $\pi/4$

Radius of greater circle $1/\sqrt{2}$ and its area $\pi/2$

The ratio of areas is $1/4 : 1/2$ or $1 : 2$.

13. N is the foot of the perpendicular from a point P of a circle with radius 7 cm, on a diameter AB of the circle. If the length of the chord PB is 12 cm, the distance of the point N from the point B is

$$3 \frac{5}{7} \text{ cm}$$

$$10 \frac{2}{7} \text{ cm}$$

$$6 \frac{5}{7} \text{ cm}$$

$$12 \frac{2}{7} \text{ cm}$$

Answer (b). In the right triangle APB, AP can be found out using Pythagoras which comes to $\sqrt{52}$.

$$\text{In triangle PNB, } PN^2 = PB^2 - NB^2$$

$$= PB^2 - (14 - AN)^2 \dots\dots 1$$

$$\text{In triangle ANP, } PN^2 = AP^2 - AN^2 \dots\dots 2$$

$$\text{Equating (1) and (2), } PB^2 - (14 - AN)^2 = AP^2 - AN^2$$

$$144 - 196 - AN^2 + 28AN = (\sqrt{52})^2 - AN^2$$

$$AN = 3 \frac{5}{7}$$

$$NB = 14 - 3 \frac{5}{7} = 10 \frac{2}{7}$$

14. A,B,C,D are four points on a circle,AC and BD intersect at a point E such that angle BEC=130° and ECD=20°.Angle BAC is

100°

110°

120°

90°

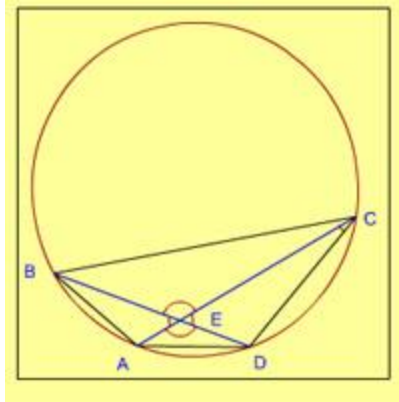

Answer (b). In triangle ECD,

angle ECD = 20°

angle CED = 50° ($180^\circ - 130^\circ = 50^\circ$)

Therefore angle EDC = 110°.

Angle BAC is also = 110° (since angles subtended in the same segment are equal.)

15. The radius of a circle is a side of a square. The ratio of the areas of the circle and the square is

$\pi : 2$

$2 : \pi$

$1 : \pi$

$\pi : 1$

Answer (d). Let the side of the square be 1 unit

Area of the square = 1 sq unit.

Area of the circle = $\pi \times 1^2 = \pi$ sq units.

The required ratio = $\pi : 1$.
