Q2791123 Read the following passage and answer the questions that follow:

Quicksand is a colloid hydrogel consisting of fine granular material (such as sand, silt or clay), and water. Quicksand forms in saturated loose sand when the sand is suddenly agitated. When water in the sand cannot escape, it creates a liquefied soil that loses strength and cannot support weight. Quicksand can form in standing water or in upwards flowing water (as from an artesian spring). In the case of upwards flowing water, forces oppose the force of gravity and suspend the soil particles. The saturated sediment may appear quite solid until a sudden change in pressure or shock initiates liquefaction. This causes the sand to form a suspension and lose strength. The cushioning of water gives quicksand, and other liquefied sediments, a spongy, fluid-like texture. Objects in liquefied sand sink to the level at which the weight of the object is equal to the weight of the displaced soil/water mix and the submerged object floats due to its buoyancy. Liquefaction is a special case of quicksand. In this case, sudden earthquake forces immediately increase the pore pressure of shallow groundwater. The saturated liquefied soil loses strength, causing buildings or other objects on that surface to sink. A human is unlikely to sink entirely into quicksand and drown at all due to the higher density of the fluid (assuming the quicksand is on dry ground and not under water, but even if underwater, sinking is still improbable). Quicksand has a density of about 2 grams per millilitre, whereas the density of the human body is only about 1 gram per millilitre. At that level of density, sinking in quicksand is impossible. Descending about up to the waist is possible, but not any further. Even objects with a higher density than quicksand will float on it—until they move. Aluminium, for example, has a density of about 2.7 grams per millilitre, but a piece of aluminum will float on top of quicksand until motion causes the sand to liquefy. Continued or panicked movement, however, may cause a person to sink further in the quicksand. Since it increasingly impairs movement, it can lead to a situation where other factors such as weather exposure, dehydration, hypothermia, tides or carnivores may harm a trapped person.

Q2791125 The factors that could harm a person in quick sand other than sinking is

Q2791492 **Read the following passage and answer the questions based on the information provided in the passage.**

The old lady was glad to be back at the block of flats where she lived. Her shopping had tired her, and her basket had grown heavier with every step of the way home. In the lift her thoughts were on lunch and good rest, but when she got out at her own floor, the thoughts vanished with her sudden discovery that her front door was open. She was thinking that she must reprimand her daily maid the next morning for such a monstrous piece of negligence, when she remembered that she had gone shopping after her maid had left and she had turned both the keys in their locks. She walked slowly into the hall and at once noticed that all the room doors were open yet following her regular practice, she had shut them before going out. Looking into the drawer room, she saw a scene of confusion over by her writing desk. It was as clear as daylight then that burglars had forced an entry in her absence. Her first impulse was to go around all the rooms looking for the thieves, but then she decided that at her age it might be more prudent to have someone with her, so she went to fetch the porter from the basement. By this time her legs were beginning to tremble, so she sat down and accepted a cup of very strong tea, while he telephoned the police. Then her composure regained, she was ready to set off with the porters assistance to search for any intruders who might be lurking in her flat.
